Octave Quick Reference Octave Version 1.1.1

Starting Octave

octave start interactive Octave session octave file run Octave on commands in file octave --help describe command line options

Stopping Octave

				O .
auit	or	exit	exit	Octave

INTERRUPT (e.g. C-c) terminate current command and return to top-level prompt

Getting Help

help	list all commands	s and built-in variables
------	-------------------	--------------------------

help command briefly describe command

help -i use Info to browse Octave manual help -i command search for command in Octave manual

Motion in Info

SPC or C-v scroll forward one screenful DEL or M-v scroll backward one screenful

C-1 redraw the display

Node Selection in Info

n	select the next node
p	select the previous node
u	select the 'up' node
t	select the 'top' node
d	select the directory node

select the first node in the current file select the last node in the current file reads the name of a node and selects it kills the current node

Searching in Info

bear ching	111 11110			
s	search	for	a	string

C-s	search forward incrementally
C-r	search backward incrementally
i	search index & go to corresponding node
,	go to next match from last 'i' command

Command-Line Cursor Motion

C-b	move back one character
C-f	move forward one character
C-a	move the the start of the line
С-е	move to the end of the line
M-f	move forward a word
M-b	move backward a word
C-1	clear screen, reprinting current line at top

Inserting or Changing Text

M-TAB	insert a tab character
DEL	delete character to the left of the cursor
C-d	delete character under the cursor
C-v	add the next character verbatim
C-t	transpose characters at the point
M_+	transpose words at the point

surround	optional	arguments	 show	one	or	more	argum	ents

Copyright 1996, 1997 John W. Eaton Permissions on back

Killing and Yanking

C-k	kill to the end of the line
С-у	yank the most recently killed text
M-d	kill to the end of the current word
M-DEL	kill the word behind the cursor
M-y	rotate the kill ring and yank the new top

Command Completion and History

Command Completion and History		
TAB	complete a command or variable name	
M-?	list possible completions	
RET	enter the current line	
C-p	move 'up' through the history list	
C-n	move 'down' through the history list	
M-<	move to the first line in the history	
M->	move to the last line in the history	
C-r	search backward in the history list	
C-s	search forward in the history list	
$\mathtt{history} \; \big[\text{-}\mathrm{q} \big] \; \big[N \big]$	list N previous history lines, omitting	
	history numbers if -q	
$\texttt{history -w} \ \big[\mathit{file} \big]$	write history to file (~/.octave_hist if no	
	file argument)	
history -r $[file]$	read history from file (~/.octave_hist if	
	no file argument)	
${\tt edit_history}\ lines$	edit and then run previous commands	
	from the history list	
run_history lines	run previous commands from the history list	
[beg] $[end]$	Specify the first and last history	
	commands to edit or run.	
If beg is greater t	than end, reverse the list of commands	
before editing. If	end is omitted, select commands from	

beg to the end of the history list. If both arguments are omitted, edit the previous item in the history list.

Shell Commands

$\begin{array}{c} \texttt{cd} \ dir \\ \texttt{pwd} \end{array}$	change working directory to dir print working directory
ls [options]	print directory listing
getenv (string)	return value of named environment variable
system (cmd)	execute arbitrary shell command string

Matrices

Square brackets delimit literal matrices. Commas separate elements on the same row. Semicolons separate rows. Commas may be replaced by spaces, and semicolons may be replaced by one or more newlines. Elements of a matrix may be arbitrary expressions, provided that all the dimensions agree.

[x , y ,]	enter a row vector
$[x; y; \dots]$	enter a column vector
[w, x; y, z]	enter a 2×2 matrix

Ranges

base	:	limit	
base	:	incr:	limit

Specify a range of values beginning with base with no elements greater than limit. If it is omitted, the default value of incr is 1. Negative increments are permitted.

Arithmetic and Increment Operators

x + y	addition
x - y	subtraction
x * y	matrix multiplication
x .* y	element by element multiplication
x / y	right division, conceptually equivalent to
	(inverse (y') * x')'
$x \cdot / y$	element by element right division
$x \setminus y$	left division, conceptually equivalent to
	inverse (x) * y
$x \cdot \ y$	element by element left division
$x \hat{y}$	power operator
$x \cdot \hat{y}$	element by element power operator
- x	negation
+ x	unary plus (a no-op)
x ,	complex conjugate transpose
x .,	transpose
++ x (x)	increment (decrement) x, return new value
x ++ (x)	increment (decrement) x, return old value

Assignment Expressions

var = expr	assign expression to variable	
var (idx) = expr	assign expression to indexed variable	

Comparison and Boolean Operators

These operators work on an element-by-element basis. Both arguments are always evaluated.

x < y	true if x is less than y
$x \leftarrow y$	true if x is less than or equal to y
x == y	true if x is equal to y
$x \ge y$	true if x is greater than or equal to y
x > y	true if x is greater than y
x != y	true if x is not equal to y
x & y	true if both x and y are true
$x \mid y$	true if at least one of x or y is true
! bool	true if bool is false

Short-circuit Boolean Operators

Operators evaluate left-to-right, expecting scalar operands. Operands are only evaluated if necessary, stopping once overall truth value can be determined. Operands are converted to scalars by applying the all function.

```
x &  x &  y true if both x and y are true x \mid | y true if at least one of x or y is true
```

Operator Precedence

Here is a table of the operators in Octave, in order of increasing precedence.

; ,	statement separators
=	assignment, groups left to right
&&	logical "or" and "and"
l &	element-wise "or" and "and"
< <= == >= > !=	relational operators
:	colon
+ -	addition and subtraction
* / \ .* ./ .\	multiplication and division
, ,	transpose
+ - ++ !	unary minus, increment, logical "not"
^ .^	exponentiation

Statements

for identifier = expr stmt-list endfor

Execute *stmt-list* once for each column of *expr*. The variable *identifier* is set to the value of the current column during each iteration.

> st st

```
while (condition) stmt-list endwhile
```

Execute stmt-list while condition is true.

break exit innermost loop
continue go to beginning of innermost loop
return return to calling function

if (condition) if-body [else else-body] endif

Execute *if-body* if *condition* is true, otherwise execute *else-body*.

if (condition) if-body elseif (condition) elseif-body endif Execute if-body if condition is true, otherwise execute the

elseif-body corresponding to the first elseif condition that is true, otherwise execute else-body.

Any number of elseif clauses may appear in an if statement.

 $\verb"unwind_protect" body \verb"unwind_protect_cleanup" cleanup" end$

Execute body. Execute cleanup no matter how control exits body.

Defining Functions

rand (n, m)

```
\begin{array}{c} \textbf{function} \ \left[ \textit{ret-list} \right] \ \textit{function-name} \ \left[ \ (\textit{arg-list}) \ \right] \\ \textit{function-body} \\ \textbf{endfunction} \end{array}
```

ret-list may be a single identifier or a comma-separated list of identifiers delimited by square-brackets.

arg-list is a comma-separated list of identifiers and may be empty.

Basic Matrix Manipulations

Basic Matrix I	Manipulations
rows (a)	return number of rows of a
columns (a)	return number of columns of a
all (a)	check if all elements of a nonzero
any (a)	check if any elements of a nonzero
find (a)	return indices of nonzero elements
sort (a)	order elements in each column of a
sum (a)	sum elements in columns of a
prod (a)	product of elements in columns of a
min (args)	find minimum values
max (args)	find maximum values
rem(x, y)	find remainder of x/y
reshape (a, m, n)	reformat a to be m by n
•	create diagonal matrices
linspace (b, l, n)	create vector of linearly-spaced elements
logspace (b, l, n)	create vector of log-spaced elements
eye (n, m)	create n by m identity matrix
ones (n, m)	create n by m matrix of ones
zeros (n, m)	create n by m matrix of zeros

create n by m matrix of random values

C-style Input and Output

fopen (name, mode) open file name fclose (file) close file printf (fmt, ...) formatted output to stdout fprintf (file, fmt, ...) formatted output to file sprintf (fmt, \ldots) formatted output to string scanf(fmt)formatted input from stdin fscanf (file, fmt) formatted input from file sscanf (str, fmt) formatted input from string fgets (file, len) read len characters from file flush pending output to file fflush (file) ftell (file) return file pointer position frewind (file) move file pointer to beginning freport print a info for open files fread (file, size, prec) read binary data files fwrite (file, size, prec) write binary data files determine if pointer is at EOF feof (file)

A file may be referenced either by name or by the number returned from fopen. Three files are preconnected when Octave starts: stdin, stdout, and stderr.

Other Input and Output functions

save file var ... save variables in file

load file load variables from file

disp (var) display value of var to screen

Miscellaneous Functions

eval (str) evaluate str as a command

feval (str, ...) evaluate function named by str, passing
 remaining args to called function

error (message) print message and return to top level

clear pattern
exist (str)
who
clear variables matching pattern
check existence of variable or function
list current variables

Polynomials

compan (p)companion matrix conv(a, b)convolutiondeconv(a, b)deconvolve two vectors poly (a) create polynomial from a matrix polyderiv (p) derivative of polynomial polyreduce (p) integral of polynomial polyval (p, x)value of polynomial at xpolyvalm (p, x)value of polynomial at xroots (p) polynomial roots residue (a, b)partial fraction expansion of ratio a/b

Statistics

Basic Plotting

 gplot [ranges] expr [using] [title] [style]
 2D plotting

 gsplot [ranges] expr [using] [title] [style]
 3D plotting

 ranges
 specify data ranges

 expr
 expression to plot

 using
 specify columns to plot

 title
 specify line title for legend

 stule
 specify line style

If ranges are supplied, they must come before the expression to plot. The using, title, and style options may appear in any order after expr. Multiple expressions may be plotted with a single command by separating them with commas.

 set options
 set plotting options

 show options
 show plotting options

 replot
 redisplay current plot

 closeplot
 close stream to gnupl

closeplot close stream to gnuplot process purge_tmp_files clean up temporary plotting files

automatic_replot built-in variable

Other Plotting Functions

plot (args) 2D plot with linear axes semilogx (args) 2D plot with logarithmic x-axis semilogy (args) 2D plot with logarithmic y-axis loglog (args) 2D plot with logarithmic axes bar (args) plot bar charts stairs (x, y)plot stairsteps hist (y, x)plot histograms title (string) set plot title axis (limits) set axis ranges xlabel (string) set x-axis label ylabel (string) set y-axis label grid on off set grid state hold on off set hold state ishold return 1 if hold is on, 0 otherwise mesh(x, y, z)plot 3D surface meshdom (x, y)create mesh coordinate matrices
